{
    /*************************************************************
     * Perimeter and Area of shapes comparing using
     * overloading frined functions and class methods
     * ___________________________________________________________
     * This program prompts the user to input information for a
     * shape of square and a shape of triangle. then using the
     * virtual methods and inheritance of the classes, calculates
     * the perimeter and area of those shapes, then using the
     * frined class functions and class methods, the program
     * compares the area and perimeter of the squares with the
     * area and perimeter of the triangle. then outputs if any
     * attributes of these shapes were equal, then again promts the
     * user how many units they want to increase the length of both
     * shapes and again print outs the attribute of the shapes
     *
     * ___________________________________________________________
     * INPUT: square length, triangle sides
     *
     * OUTPUT: prints out the perimeter and area of the both shapes
     *         based on the information that the user put in, the
     *         result of the comparison of the attributes, and the
     *         new attributes after the modification
     *
     *************************************************************/
